

PA.136.MPC Spinal Orthosis

Maryland Physicians Care considers **Spinal Orthoses** medically necessary for the following indications:

Thoracic-Lumbar-Sacral Orthoses (TLSO), Lumbar-Sacral Orthoses (LSO) and Lumbar Orthoses with custom fitting indications:

- To reduce pain by restricting mobility of the trunk
OR
- To facilitate healing following an injury to the spine or related soft tissues
OR
- To facilitate healing following a surgical procedure on the spine or related soft tissue;
OR
- To otherwise support weak spinal muscles or a deformed spine

Custom fabricated or molded **Spinal Orthoses** indications:

- The treatment of scoliosis (including Milwaukee scoliosis braces, Boston scoliosis braces, Charleston scoliosis braces, Wilmington braces)
OR
- If the member has an underlying deformity or body somatotype which would preclude the use of a prefabricated brace

Background

CMS defines an orthosis or brace as a rigid or semi-rigid device which is used for the purpose of supporting a weak or deformed body member or restricting or eliminating motion in a diseased or injured part of the body. An orthosis can be classified as either prefabricated (off-the-shelf or custom fitted) or custom-fabricated.

A spinal orthosis is designed to control gross movement of the trunk and intersegmental motion of the vertebrae in one or more planes of motion:

- Lateral/flexion (side bending) in the coronal/frontal plane. Control of this plane is achieved by a rigid panel in the mid-axillary line, which is either an integral part of a posterior or anterior panel, or a separate panel.
- Anterior flexion (forward bending) or posterior extension (backward bending) in the sagittal plane. Control of this plane is achieved by a rigid posterior panel.
- Axial rotation (twisting) viewed in the transverse plane. Straps over the shoulders attaching to a posterior panel alone do not provide transverse spinal control.
